

Wamu Uganda

One app for discovery, chat, commerce, delivery, and rides.

"Jumia built a warehouse. We are building a neighborhood."

Presenter: [Your Name]

Date: 2026

We are not another Jumia. We are the app that replaces the 4 apps Ugandans already use every day: WhatsApp, TikTok, SafeBoda, and their payment apps.

The Problem

In Uganda, everyday commerce is scattered across four apps and a phone call.

WhatsApp

Chat
with the business

TikTok

Discover
local businesses

- Businesses juggle 4 apps to reach customers.
- Customers juggle 4 apps to buy one lunch.
- No single app connects discovery, chat, payment, and delivery.
- Jumia exists — but it is a warehouse, not a neighborhood.

The Solution

Wamu is Uganda's transaction layer. One account, one app, one loop.

Discover → **Chat** → **Buy** → **Pay** → **Deliver** → **Review**

Jumia

- Product grid
- Anonymous seller
- Cart + checkout
- Warehouse shipping
- 3–5 days delivery
- Cards

Wamu

- Video feed
- Named, verified merchant
- Chat-based ordering
- Neighborhood rider
- Minutes, not days
- MoMo first

The Product — Customer App

```
<div class="phone"><div class="screen">
  <div class="label">Mama Grace Kitchen ✓</div>
  <div class="msg me">Do you have tilapia today?</div>
  <div class="msg">Yes! Fresh. 15k each.</div>
  <div class="msg me">2 for 25k?</div>
  <div class="msg">Yes, for you.</div>
  <div class="order-card">2× Tilapia – 25,000 UGX<br><span style="color:
</div><p style="text-align:center;font-size:0.8em;margin-top:6px;">Chat
```

```
<div class="phone"><div class="screen">
  <div class="map"></div>
  <div class="rider"><div class="avatar">R</div><div>Ronald K. ✓<br><span>
  <div class="eta">ETA: 12 min</div>
</div><p style="text-align:center;font-size:0.8em;margin-top:6px;">Live
```

```
<div class="phone"><div class="screen">
  <div class="map"></div>
  <div class="rider"><div class="avatar">R</div><div>Ronald K. ✓<br><span>
```

```
<div class="eta">Kampala Road · 8,000 UGX</div>  
</div><p style="text-align:center;font-size:0.8em;margin-top:6px;">Wamu
```

Same rider. Same app. Same account. Delivery and rides in one network.

The Product — Merchant & Rider

```
<div class="phone"><div class="screen">
  <div class="label">New Order</div>
  <div class="order-card">2× Tilapia – 25,000 UGX<br>To: Ntinda</div>
  <div class="btn">Accept</div>
  <div class="btn-outline">Reject</div>
</div><p style="text-align:center;font-size:0.8em;margin-top:6px;">Inco
```

```
<div class="phone"><div class="screen">
  <div class="label">Welcome, Ronald ✓</div>
  <div class="sub">Available for Delivery: ON</div>
  <div class="sub">Available for Rides: ON</div>
  <div class="sub">Today: 8 deliveries · 3 rides</div>
  <div class="sub">Earnings: 42,000 UGX</div>
</div><p style="text-align:center;font-size:0.8em;margin-top:6px;">Ride
```

```
<div class="phone"><div class="screen">
  <div class="label">Ride Request</div>
  <div class="order-card">Pickup: Sarah (1.5 km)<br>Dropoff: Kampala Rd
```

```
<div class="btn">Accept</div>
</div><p style="text-align:center;font-size:0.8em;margin-top:6px;">Incoi
```

One rider network. Two service types. Higher rider earnings. Better customer experience.

Why Now

- **Smartphone adoption is rising** across Uganda.
- **Mobile money is mainstream** — MTN MoMo and Airtel Money have millions of users.
- **Boda riders are everywhere** — the delivery and ride network already exists.
- **Social commerce is exploding** — businesses already sell on WhatsApp and TikTok.
- **No one has connected it all.** Jumia is a warehouse. SafeBoda is rides. TikTok is entertainment. WhatsApp is chat. Nobody owns the loop.

The infrastructure exists. The behavior exists. The app does not.

Traction — Concierge MVP

Before writing a single line of code, we ran a manual concierge MVP in Kampala.

Metric	Result
Merchants onboarded	[Your number]
Riders engaged	[Your number]
Orders processed	[Your number]
Repeat customer rate	[Your number]%
Average order value	[Your number] UGX
Average delivery time	[Your number] min

These numbers are from real customers, real merchants, and real riders — not projections.

Replace bracketed values with your actual concierge MVP results.

The Demo

We are building a working demo that proves the full loop end to end.

1. Discover

2. Chat

3. Pay (MoMo)

4. Deliver

5. Ride

Built in 6 weeks by a solo developer with 4 years of experience.
Stack: Flutter · Python FastAPI · PostgreSQL · Redis · Google Maps ·

MTN MoMo (mocked for demo).

The Ask

We are raising **[Amount]** to:

1. Complete the production build of the customer, merchant, and rider apps.
2. Integrate real MTN MoMo and Airtel Money payments.
3. Launch in one Kampala neighborhood with 20 merchants and 50 riders.
4. Prove the loop: 100 deliveries/day, 30% repeat rate.
5. Expand to 5 neighborhoods within 12 months.

Use of funds: 60% engineering · 20% operations · 15% marketing · 5% legal & compliance.

Adjust percentages and amounts to your plan.

Vision

"One app. One account. One neighborhood at a time."

Wamu is not another Jumia. It is not another WhatsApp. It is not another SafeBoda.

Wamu is the app that makes them all unnecessary inside one connected ecosystem.

Kampala → Uganda → East Africa

Build the loop. Win the city. Scale the ecosystem.
